Feature Geometry and Applications in Deep Learning

Lizhong Zheng

IAS Workshop, Hong Kong, July, 2023

Shashank Jere, Lingjia Liu (VT)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- Applications of DNN in engineering problems are different from NLP/Image Processing
 - Limited training;
 - Domain knowledge and structures, do not re-learn what is known;
 - Guarantees;
 - Parameterized optimal solutions;
 - Targetted performance enhancement (performance comparison table is often not the right way.)

The Role of Information Theory

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ ○ 臣 ○ の Q @

 Information theoretic quantities, entropy, mutual information, K-L divergence, etc., are pleasant concepts, and therefore used in many learning problems as a part of the loss function.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- Information theoretic quantities, entropy, mutual information, K-L divergence, etc., are pleasant concepts, and therefore used in many learning problems as a part of the loss function.
- The operational meanings for information-theoretic quantities: the coding theorems, "max rate with $P_e \rightarrow 0$ as $n \rightarrow \infty$ ".

- Information theoretic quantities, entropy, mutual information, K-L divergence, etc., are pleasant concepts, and therefore used in many learning problems as a part of the loss function.
- The operational meanings for information-theoretic quantities: the coding theorems, "max rate with $P_e \rightarrow 0$ as $n \rightarrow \infty$ ".
- The current operational meaning of IT quantities in ML: when used in the loss function, the performance is sometimes better.

Need Some Re-Thinking

• Reservoir computing works quite well.

(Good) Blackboxes Work, Sort of.

- Train a network, with Y[n] as input and try to predict X[n] (sorry for the convention).
- Reservoir computing works quite well.
- There is an issue of error floor, performance gap to the optimal at high SNR: the deconvolution didn't work too well.

Moving towards Understanding

- Performance metrics might be misleading, both learning performance metrics and communication metrics.
 - Weak interference can be handled with classical approaches.
 - Strong interference occurs rarely.
 - Switching is not hard for engineers.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

• Inverse z-transform by partial fraction expansion

$$\min \mathbb{E}_{\alpha} \left[\left\| \frac{1}{1 - \alpha z^{-1}} - \widehat{h_{\text{res}}^{-1}} \right\|^2 \right]$$

A Problem We Can Do

Simplest reservoir: no connection, no non-linear.

Need to choose β_1, \ldots, β_M , a random choice of the target α with a given prior p_{α} ,

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ ○ 臣 ○ の Q @

• Why is reservoir a good idea? If $\beta_i = \alpha$, we have no error.

- The scaling law of performance (training loss), how does $\|\text{error}\|^2$ decrease with M: $O(M^{-4})$.
- Optimal reservoir size with limited training: standard generalization error analysis.
- How to place β 's? Randomly with density $\propto \frac{1}{(1-\beta^2)^{\frac{5}{4}}}$ if p_{α} is uniform.
- When we know p_α(3GPP/LTE), easily fold in the prior knowledge.

With all these, the error floor is pushed down.
